Patent Specification

◎ Abstract

Abstract

The invention relates to the personal private information management system which its own profile is transmitted to the others by using the cellular phone or can be received the others' profile, and included of the user is its own computer the step of connecting to the internet network in the server of administrator, the step that user requests member joining, and storing in the profile DB, and the cellular phone step of transmitting to the cellular phone of the receiver which connects to the communications company and operator's network. Therefore, the transmission of the profile more quick and exact possible as to the step that user requests member joining, and, its own profile is transmitted and which administrator manages, as to the cellular phone step of the own of requesting the profile electric of transmission it inputs and the communications company receiving the profile submission from user inform the profile submission fact of user to administrator, and in which the step of demanding the thing, displayed and the administrator requested the profile of user from the communications company refer to the profile DB and extracting the profile of the corresponding user, and which for the step that this is transmitted again in the communications company received profile from administrator, user designate the user joining in the members store the profile of oneself. Efficiently, profile can be managed.

The Detailed Description of Invention

The Purpose of Invention

Field of Invention and the Prior Art

The invention relates to the personal private information management system which its own profile is transmitted to the others by using the cellular phone or can be received the others profile. And particularly, by the user joining in the members in advance storing its own profile in the system of administrator and using the cellular phone, its own profile is transmitted in the cellular phone of opponent. Therefore, it is about the personal private information management system using the cellular phone which removes to troublesome and more efficiently can more efficiently the profile of individual of the ebb, exchanging for the same card.

Recently, it is rooted into somebody/something as one of the necessities of life while the demand of the cellular phone increases suddenly.

Moreover, it exists and its own profile is be acknowledged for rapidly as to interpersonal to opponent. It is attached great importance than what to efficiently manage the profile of opponent.

But there is a problem that in convention, the administration very troublesome since to storing after one by one inputting the new man to the separate name card management program installed at the case the name card is decreased when meeting and each other dialling box and the profile of the name, company, the address, the telephone number etc. of opponent can be dropped each other as receiving, and therefore, of the business card being lost with the carelessness and losing at failure. In this or computer the name card is safekept in the administration thus business card book etc. It.

Technical Problems to be solved by the Invention

The invention relates to the members to the communications company (200), offering the personal information offer service between the administrator (100), equipped with the profile DE (400) saving the profile of the members and administrator (100) and user and administrator (100), and it joins and profile is delivered to its own cellular phone through the communications company. It connects with the received user (300). The step (S501) where the user (300) connects as its own computer to the server of the administrator (100) as the internet network and user (300) request member joining. The step (S502) in which its own profile is transmitted and it connects as the communications company (200) and wireless network and in which the step (S503) which stores in the profile DE (400) which the administrator (100) manages and the user (300) joining in the members input the telephone number of receiver to the cellular phone and in order to transmit its own profile requesting the profile electrical transmission and the communications company (200) receiving the profile submission from the user (300) inform the profile submission fact of the user (300) to the administrator (100). The step (S504) which demands to dispatch the profile of the user (300) and the administrator (100) requested the profile of the user (300) from the communications company (200) refer to the profile DE (400) and the profile of the corresponding user (300) is extracted. This is transmitted again in the communications company (200) and it is included of the step (S505) stored in the receiver allocation spaces of the administrator (100) server, and the step (S506) where the communications company (200) that it is received transmits profile from the administrator (100) with the cellular phone of the receiver at the same time. The step (S507) where the communications company (200) that it is received transmits profile from the administrator (100) with the cellular phone of the receiver the user (300) designates.

The Structure and Function of the Invention Device

Hereinafter, the preferred embodiment of the present invention is introduced referring to the figure particularly.

Figure 1 to fig. 2 is the flowchart of the invention personal private information management system the configuration diagram of the invention.

The invention relates to the members to the communications company (200), offering the personal information offer service between the administrator (100), equipped with the profile DE (400) saving the profile of the members and administrator (100) and user and administrator (100), and it joins and profile is delivered to its own cellular phone through the communications company. It connects with the received user (300). The step (S501) where the user (300) connects as its own computer to the server of the administrator (100) as the internet network and user (300) request member joining. The step (S502) in which its own profile is transmitted and it connects as the communications company (200) and wireless network and in which the step (S503) which stores in the profile DE (400) which the administrator (100) manages and the user (300) joining in the members input the telephone number of receiver to the cellular phone and in order to transmit its own profile requesting the profile electrical transmission and the communications company (200) receiving the profile submission from the user (300) inform the profile submission fact of the user (300) to the administrator (100). The step (S504) which demands to dispatch the profile of the user (300) and the administrator (100) requested the profile of the user (300) from the communications company (200) refer to the profile DE (400) and the profile of the corresponding user (300) is extracted. This is transmitted again in the communications company (200) and it is included of the step (S505) stored in the receiver allocation spaces of the administrator (100) server, and the step (S506) where the communications company (200) that it is received transmits profile from the administrator (100) with the cellular phone of the receiver at the same time. The step (S507) where the communications company (200) that it is received transmits profile from the administrator (100) with the cellular phone of the receiver the user (300) designates.

Moreover, as described above, for the user (300) joining in the members, the profile of the user (300) dispatching in the administrator (100) server which the user (300) receiving reception is allocated is saved profile to the other member in the electrical transmission.

Hereinafter, each single step action of the present invention is introduced particularly.

It connects to the server of the administrator (100) as the internet network and for the user (300), the user (300) requests member joining to its own computer, its own profile is transmitted and it particularly records the name, user's place of employment, office telephone number, mobile phone number, anniversary etc. of user in the member-joining application and the subscription uses degradation transmits from the step (S502) stored in the profile DE (400) which the administrator (100) manages with the members in the server of the administrator (100). The administrator (100) stores the profile it examined the application for admission and it was subscribed to the user (300) to the members in case errorred no. which notifies and which the user (300) transmits in the profile DE (400).

At this time, the business of company as well as the profile of individual, the business status, the major product etc. are stored together in the profile DE (400) of the administrator (100) in the storage. Therefore, the long period takes from the death the memory about the user in the progress.

After the mobile phone number of the user (300) joining in the members knows its own profile at the step (S503) connects as the communications company (200) and wireless network and in which the user (300) joining in the members inputs the telephone number of receiver to the cellular phone and in order to transmit its own profile requesting the profile electrical transmission is recognized. It connects to the profile transmit service of the communications company (200) through the wireless network as the cellular phone. After ID or password etc. are inputted and oneself informs the members the electrical transmission uses degradation inputs the mobile phone number of receiver.

The communications company (200) receiving the profile transmission from the user (300) informs the profile submission fact of the user (300) to the administrator (100). It requests to dispatch the profile of the user (300). It refers to the profile DE (400) and the administrator (100) requested the profile of the user (300) from the communications company (200) extracts the profile of the corresponding user (300). This is transmitted again in the communications company (200).

The communications company (200) receives profile from the administrator (100) and transmits the profile of the user (300) with the cellular phone of the receiver which the user (300) designates.

In the meantime, in order to use this service, it connects to its own computer to the server of the administrator (100) and it downloads the contents management of one's body program and it establishes and it stores the profile which one self is received or the profile which it separately inputs in its own computer and the user (300) joining in the members manager, or the fixed space is allocated and it thus stores in the server of the administrator (100) and it can manage.

In this way, after using the saved others' profile, the special treatment person to classified separately, birthday, anniversary etc. are informed to the user (300). Therefore, the more effective management of one's body is included.

Moreover, the profile in which the members used the cellular phone to nonmember and nonmember was received the profile of the members in sending was stored for the specified period in the administrator (100) server and the service downloading the information pre-stored to the members in the substation can be offered.

As described above, the invention relates to the user (300) to its own cellular phone, and the efficient management of one's body the profile which it in advance stored is transmitted in the others' cellular phone in the administrator (100) server through the communications company (200) are made possible, and the transmission of the profile quick and easy is possible.

Effect of Invention (Device)

As described above, the invention relates to the members. And the user (300) in advance stored its own profile in the server of the system operator and it transmits with the cellular phone of the user which wants to inform its own profile. Therefore, the transmission of the profile more quickly and easily is possible. Profile can be managed efficiently.

Scope of Claim(s)

Claim [1]

It joins to the communications company (200), offering the personal information offer series between the administrator (100), equipped with the profile DE (400) storing the profile of the members and administrator (100) and user and administrator (100) in the members said profile is delivered to its own cellular phone through the communications company. It constitutes with the received user (300). The step (S501) where the user (300) connects to its own computer to the server of the administrator (100) as the Internet network and user (300) requests member joining. The step (S503) in which the own profile is transmitted and it connects to the communications company (200) and wireless network and in which the step (S502) which stores in the profile DE (400) which the administrator (100) manages and the user (300) joining in the members input the telephone number of receiver to the cellular phone and in order to transmit its own profile requesting the profile electrical transmission and the communications company (200) receiving the profile transmission from the user (300) inform the profile administration fact of the user (300) to the administrator (100). The step (S504) which transmits to depict the profile of the user (300) and the administrator (100) requested the profile of the user (300) from the communications company (200) refer to the profile DE (400) and the profile of the corresponding user (300) is extracted. This personal private information management system using the cellular phone which characterizes to again transmit this in the communications company (200) and be included of the step (S505) stored in the receiver allocation space of the administrator (100) server, and the step (S506) where the communications company (200) that it is received transmits profile from the administrator (100) with the cellular phone of the receiver at the same time. The step (S507) where the communications company (200) that it is received transmits profile from the administrator (100) with the cellular phone of the receiver the user (300) designates.

Claim [2]

The personal private information management system in which the user (300) joining as to the first claim in the members uses the cellular phone which characterizes that the profile of the user (300) disappears in the administrator (100) server while the user (300) receiving reception is allocated is saved profile to the other member in the electronic transaction.
